AIMS AND SCOPE

The primary aim of *Clinical Vision Sciences* is to promote communication among workers in basic and clinical vision research. The journal will encourage the publication of detailed studies that use clinical material to address important issues in basic science. It will also encourage the use of basic scientific methods to address questions of clinical relevance. The word clinical is used in a very broad sense, such that studies on animals and normal human observers, if of general relevance to clinical issues, will also be welcomed.

A second important aim of this journal is to bring together in one place the important studies in the many diverse areas of basic vision research that impinge upon the clinical domain. These areas include psychophysics, electrophysiology, visual development (animal and human), neuropharmacology, animal models (behaviour, electrophysiology and pathology), eye-movements, geometric and physiological optics.

This is a journal with wide interests, a clinical bias and an overriding emphasis on basic science.
